1 LaTeX Physics Package

This extension is to mimics [LaTeX Physics Package](#)¹ in MathJax.

2 Commands not Working and Helps Needed

The following commands in the Physics Package is not implemented yet:

- All Matrix Macros
- So far everything done here is by string substitution. Whenever commands involving the following cannot be done simply by string substitution and hence not working:
 1. * modified command
 2. [] modified command
 3. variable no. of arguments

¹<http://www.ctan.org/pkg/physics>

4. `()`, `[]` are used instead of `{}`

- Examples of commands that doesn't work:
 - `\dv`: has properties 1–3
 - `\qty`: has property 4

As I mentioned, everything done so far is by string substitution only. If you know more about Javascript and MathJax, and want to use the [LaTeX Physics Package](#)² in MathJax, please consider contributing. Some hints are given in [Pull Request#16—MathJax-third-party-extensions](#)³ but I am too stupid to understand how the above cases should be handled.

3 Organization

`README.xlslx` is the master file⁴.

- Columns A-L are copied to [test/tables.md](#)
- Columns M-V are copied to [unpacked/physics.js](#)
- Columns M-V excluding column O are copied to [test/macro.js](#)

Other files are built automatically by `README.sh`. [MultiMarkdown](#)⁵, UglifyJS2, LaTeX are assumed. I used it on Mac and have no idea if the way my bash script is written is OS agnostic or not.

4 Test

A test is given in [README.html](#) and [README.pdf](#). Compare the LaTeX output and HTML output and you will see which one is working or not.

Instead of extension, it can works as a macro too. See the test in [macro.html](#)⁶.

⁴If you are laughing right now, you should really consider contributing. See [Commands not Working/Included]].
