1 LaTeX Physics Package

This extension is to mimics LaTeX Physics Package¹ in MathJax.

2 Commands not Working and Helps Needed

The following commands in the Physics Package is not implemented yet:

- All Matrix Macros
- So far everything done here is by string substitution. Whenever commands involving the following cannot be done simply by string substitution and hence not working:
 - 1. * modified command
 - 2. [] modified command
 - 3. variable no. of arguments

¹http://www.ctan.org/pkg/physics

3. ORGANIZATION 2

- 4. (), [] are used instead of {}
- Examples of commands that doesn't work:

- \dv: has properties 1-3- \qty: has property 4

As I mentioned, everything done so far is by string substitution only. If you know more about Javascript and MathJax, and want to use the LaTeX Physics Package² in MathJax, please consider contributing. Some hints are given in Pull Request#16—MathJax-third-party-extensions³ but I am too stupid to understand how the above cases should be handled.

3 Organization

physics.xlsx is the master file⁴.

- Columns A-L are copied to test/tables.md
- Columns M-V are copied to unpacked/physics.js
- Columns M-V excluding column O are copied to test/macro.js

Other files are built automatically by physics.sh. MultiMarkdown⁵, UglifyJS2, LaTeX are assumed. I used it on Mac and have no idea if the way my bash script is written is OS agnostic or not.

4 Test

A test is given in index.html⁶ and index.pdf. Compare the LaTeX output and HTML output and you will see which one is working or not.

Instead of extension, it can works as a macro too. See the test in macro.html⁸.

²http://www.ctan.org/pkg/physics

 $^{^{3}} https://github.com/mathjax/MathJax-third-party-extensions/pull/16$

⁴If you are laughing right now, you should really consider contributing. See [Commands not Working/Included][].

 $^{^{5}} http://fletcherpenney.net/multimarkdown/download/$

 $^{^6}$ This relies on the CDN of MathJax. i.e. there might be a delay. To see instantaneous test, use macro.html 7 .
